## 9.1: Review of Radicals and Quadratic Equations

What's a radical?

$$\sqrt{x} = x^{1/2}$$

Is there a connection to exponents?

What does quadratic mean?  $2^{\text{nd}}$  degree polynomial

### I. Radicals

"Simplify" expressions

→ NO =, < or >

\*\*Use the sign shown in the problem.

$$\sqrt{4}$$

$$-\sqrt{4}$$

$$2$$

$$-2$$

"Solve" equations

→ =

\*\* Here's where you include  $\pm$ :

$$x^2 = 4 \Rightarrow x = \underline{\pm 2}$$

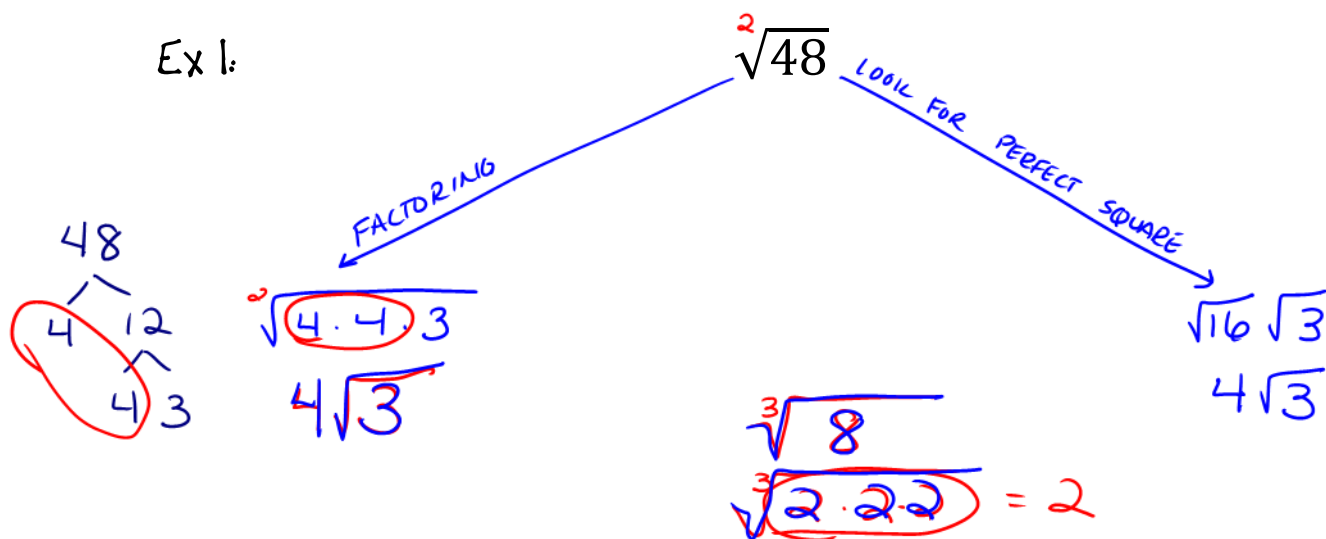

DISCLAIMER: The following notes are provided as an explanation of the math, to show what's going on mathematically. You do NOT need to write all of this for your homework.

NOTE: You need to know how to do this. Your calculator will not help you; you need to write exact answers, not decimal estimates.

If you are struggling with this then review or learn the "Divisibility Rules". You can find these with a web search.

You may use any method. I will show you two.

Ex 1:

Ex 2:

Simplify  $\sqrt{200}$

$$\sqrt{100} \sqrt{2}$$

$$10\sqrt{2}$$

Ex 3: Simplify  $\sqrt{72} = \sqrt{36} \sqrt{2} = 6\sqrt{2}$

ORDER OF OP'S

Ex 4: Simplify  $\sqrt{(9+16)}$

$$\sqrt{25}$$

$$5$$

• PEMDAS

• Please excuse my dear aunt Sally

---

(Parenth  
Expon

(Mult  
Divi

(Add  
Subtract

Ex 5: Simplify  $\sqrt{(3^2 + 4^2)}$

$$\sqrt{(9+16)}$$

$$\sqrt{25} = 5$$

Reminder: Decimal answers will not be accepted. You must provide answers in simplified, reduced, rationalized form.

Connection to prior knowledge of polynomials:

Simplify  $12x^2$  +  $10x$  -  $5x^2$

$$\boxed{7x^2 + 10x}$$

Combine like terms

Ex 6: Simplify  $\sqrt{18} + \sqrt{32} + \sqrt{75}$

$$\begin{array}{c} 9 \quad 2 \\ \textcircled{33} \quad \textcircled{2} \\ \downarrow \quad \downarrow \\ 3\sqrt{2} \quad 4\sqrt{2} \end{array} \quad \begin{array}{c} 8 \quad 4 \\ \textcircled{24} \quad \textcircled{4} \\ \downarrow \quad \downarrow \\ 2\sqrt{4} \quad 4\sqrt{2} \end{array} \quad \begin{array}{c} 25 \quad 3 \\ \sqrt{25} \sqrt{3} \end{array}$$

$$3\sqrt{2} + 4\sqrt{2} + 5\sqrt{3}$$

$$\boxed{7\sqrt{2} + 5\sqrt{3}}$$

combine like terms

$$\begin{array}{c} \sqrt{32} = \sqrt{2 \cdot 2 \cdot 2 \cdot 2 \cdot 2} \\ \begin{array}{c} 2 \quad 16 \\ \downarrow \quad \downarrow \\ 2 \quad 8 \\ \downarrow \quad \downarrow \\ 2 \quad 4 \\ \downarrow \quad \downarrow \\ 2 \quad 2 \end{array} \quad \begin{array}{c} 2 \cdot 2 \sqrt{2} \\ 4\sqrt{2} \end{array} \end{array}$$

→ undo the operation

## Rationalize the denominator

Ex 7: Simplify  $\sqrt{\frac{5}{3}} \Rightarrow \frac{\sqrt{5}}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} \Rightarrow \boxed{\frac{\sqrt{15}}{3}}$

$$(\sqrt{3}) = 3^{\frac{1}{2}}$$

$$(3^{\frac{1}{2}})^2 = 3^{(\frac{1}{2} \cdot 2)}$$

Ex 8: Simplify  $\frac{6\sqrt{3}}{\sqrt{3}} = \frac{\overset{2}{\cancel{6}}\sqrt{3}}{\underset{1}{\cancel{3}}} = 2\sqrt{3}$

Quadratics: 2<sup>ND</sup> degree polynomial

Ex 9: Solve  $x^2 - 10x = -16$

Degree of the polynomial: the highest ~~degree~~<sup>exponent</sup> of any term in the polynomial.

The Fundamental Theorem of Algebra (FTA): *for our class,* Degree of poly is MAX count of solutions

Solve

Are the "solutions" easy to spot on a graph of the polynomial?
